BioMat: Modular Sustainable Architecture

<https://urbannext.net/biomaat-modular-sustainable-architecture/>

The Mock-up demonstrates a vision for modular sustainable architecture, where annually renewable biomaterials are digitally additively fabricated to produce minimal surface modular units, which are versatile and reusable in diverse geometric constellations.

The Mock-up is 2 m high, consists of 14 modules and weighs only 20 kg. The identical modules were assembled into different foam-like lightweight compositions. The modules were fabricated by digitally tailoring natural flax fibers into specific 2D patterns following optimized structural and parametric geometrical deviations. These were later formed using a vacuum-assisted molding process into the final 3D shapes.

BioMat: Modular Sustainable Architecture

<https://urbannext.net/biomaat-modular-sustainable-architecture/>

This project is a result of three months of intensive work including computational architectural design, structural simulations, and optimizations as well as the digital fabrication phases.
