Taizhou Jiangbei Park: Riverside Greenbelt

<https://urbannext.net/taizhou-jiangbei-park-riverside-greenbelt/>

In this project, the edge of the Yongning River is turned into a riverside greenbelt with water purification capacity. With the purification efforts, the river becomes green a lung. The water quality and the riverside habitats are restored while providing an area for leisure and fitness for the residents of the surrounding area.

ISSN : 2575-5374

Additionally, the design strives to incorporate criteria of wetland conservation, water purification, and a low-carbon energy model to generate a modern, urban-themed riverside ecological leisure park. The main structure of the landscape design incorporates the three zones: a public access platform, a river purification zone, and a wetland conservation zone.

This site is located on the Yongning River north of Huangyan District in the city of Taizhou.

The park is a green belt intended to perform riverside flood control functions. The total length is about 4 km , with a total surface area of approximately 21.8 hectares. The narrowest section is 44 m, and the widest section covers 87 m.

ISSN : 2575-5374

Access Platform

Municipal roads along the south side of the site connect with a series of stepped platforms to resolve the internal site elevation. There is a bus stop, parking for cars, bike rental facilities, and parking spaces for non-motorized vehicles.

Wetland Conservation Zone

The conservation zone is intended to meet the 20-year return period flood control requirements and to provide a proper habitat for river-dwelling creatures, while offering visitors a quiet view of the riverside recreation space.
