Six glass 'icebergs' arise from the subtropical coast; the design is intended to raise awareness to the issues of global warming and marine environmental protection. Icebergs bring a surprising and refreshing image to this hustle-bustle subtropical metropolis, while ringing an alarm bell: the impact of melting ice caps at the poles may not be that far away from our everyday life!

The Maritime Museum is one of Shenzhen's "Ten New Major Cultural Facilities" and a new cultural landmark as Shenzhen strives to develop as a global maritime center. The site and the surrounding peninsula, not yet developed in real-estate terms, are already registering significant human disturbances to ocean ecology: extensive fish farming, nuclear power stations, and petroleum plants are the embodiment of our environmental vulnerability and the urgency of the crisis.

It is an incredible opportunity (and a perilous one at the same time) to build a museum about the ocean by the ocean, at this point in history and on this particular site. This is a time of great urgency to act carefully and collectively on the worsening environmental crisis facing humankind.

Taking coastal ecology as the point of departure, OPEN proposes to turn confrontation into symbiosis by replacing the planned hard and tall sea dike with a soft zone of defense in between two layers of seawalls at different heights. This in-between zone will be occupied by restored mangrove wetland, a natural protective barrier which also serves as a habitat for marine life and migrating birds.

Above the roof of the main exhibition space is the manmade Inland Sea pond which levels with the higher seawall. This strategy not only minimizes the impact on the building of the frequent seasonal typhoons, but also greatly reduces the heat load on this large-scale exhibition building in the sub-tropical climate. The main exhibition space is an expansive and tall floor allowing for maximum flexibility and easy curatorial operation. All exhibition rooms can be individually and conveniently serviced by a logistics corridor loop.

The research, office and storage components of the museum are accommodated in a glacier-like

sloping volume covered by vegetation. Naturally filtered water drawn from the mangrove wetland runs down the sloping roof, gets further filtration by the roots of plants, and finally enters the Inland Sea pond to compensate for evaporation.

Five double-layered glass iceberg-like volumes rise from the Inland Sea which house the main public programs: lobby, theater, library, and children's education areas, while providing visitors with a sense of orientation and places to rest. One Iceberg 'drifts' away into the ocean, with an impressive dome theater inside. It is the apex of the whole museum journey.

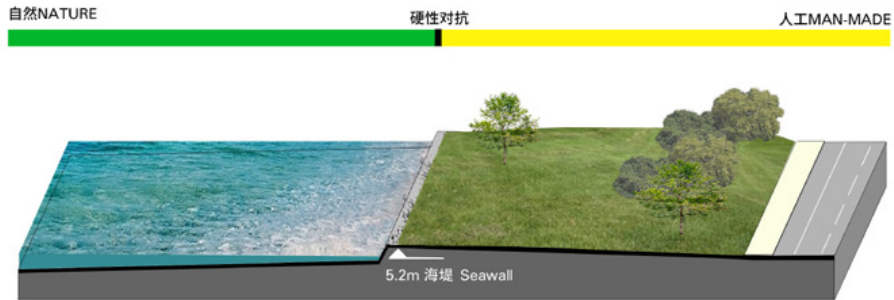

Between land and sea, architecture breathes in and out with nature, humbly.

The proposed museum is built like an organic element of nature, establishing a new and balanced ecosystem. The building intends to be an active part of marine education.
